

Newly diagnosed / untreated patient

The vaccination schedule of the general population should be applied to any patient with MS unless there is a specific contraindication (recommendation of the Haut Conseil de la Santé Publique, article L3111-1, Code de la Santé Publique)

Particular attention should be advised for:

- ✓ MMR
- ✓ Hepatitis B
- ✓ VZV
- ✓ Hepatitis A
- ✓ DTP (booster recommended at 25, 45, 65 yrs then every 10 years)

A control of the following serologies can be advised:

- ✓ Measles and rubella for patients born before 1980, with no information about status. Patients born after 1980 who received only 1 vaccine injection should be proposed a second one
- ✓ Hepatitis B
- ✓ VZV
- ✓ Hepatitis A for at risk patients.

In case of cocooning: 1 additional dose of acellular DTPc if the last whooping cough vaccine injection was done more than 5 years before
